

Code Layout, Readability and Reusability

Project: FitBuddy – AI Fitness Plan Generator Using Gemini

Purpose: Project-track submission material adapted to the supplied AI/ML/Gen-AI template.

Included source

The complete FitBuddy source archive is included in the subfolder “FitBuddy Source Code”. It retains the original project's file layout.

Maintainability practices

Keep API route handling separate from AI-generation and database logic; use clear function names; validate request data; load secrets from environment variables; document expected configuration.

Reproducibility checklist

- Use a supported Python version.
- Install dependencies from the actual dependency file, if included.
- Create a local environment file without committing real secrets.
- Configure the Gemini API key and database.
- Start the FastAPI application using the project's entry point.

Implementation verification

Check the source tree and README together before running; this package preserves the original code rather than silently rewriting application behavior.
