

Data Flow Diagram

Project: FitBuddy – AI Fitness Plan Generator Using Gemini

Purpose: Project-track submission material adapted to the supplied AI/ML/Gen-AI template.

High-level data flow

User → HTML/Jinja2 interface → FastAPI route → input validation → Gemini service → generated text/plan → database persistence → response rendered to user.

Data stores

SQLite/SQL database stores application records through SQLAlchemy. Exact tables and fields should be confirmed against the included source files.

External service

Google Gemini receives prompt data needed to generate a response. Configure credentials using environment variables and avoid sending unnecessary personal data.

Error paths

Validation failures return an appropriate client error; AI service failures and database errors should be handled without exposing stack traces or API keys.
